

**ORGANIC CUMMULATIVE EXAM**

**March 6, 1999**

Name \_\_\_\_\_

1. Give the structure of the compound  $C_9H_{10}O$  the spectral data of which are given on the next page. Give your answer here and provide the rationale for you decision. Assign the NMR spectra on the following page.

MF C<sub>9</sub>H<sub>10</sub>O

MW 134

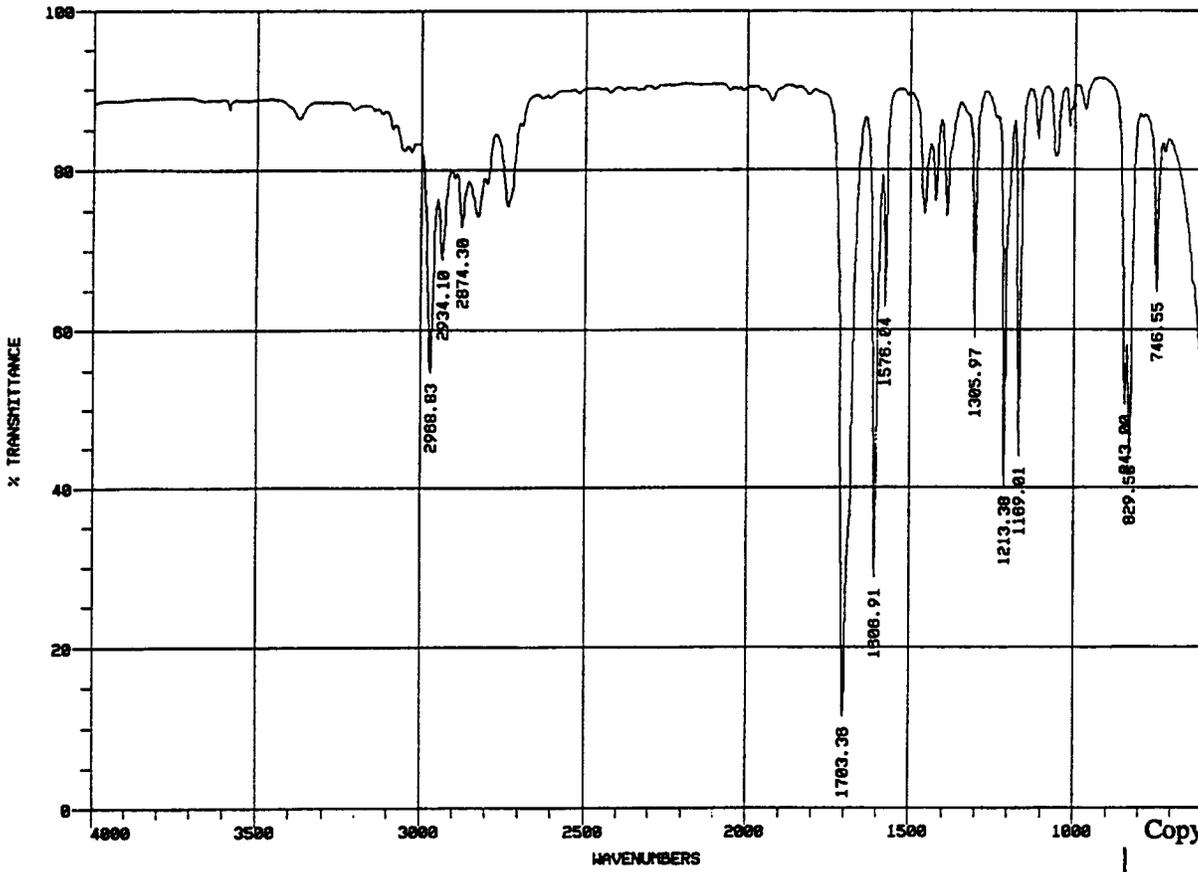

%C 80.6

%H 7.5

2. Below and on the following page you will find three mass spectra. These are of a set of isomeric amines having the structures **A**, **B**, and **C**. In the space below show which structure goes with which mass spectrum and indicate reasoning behind your decision. In each case give the structure of the ion giving the base peak.

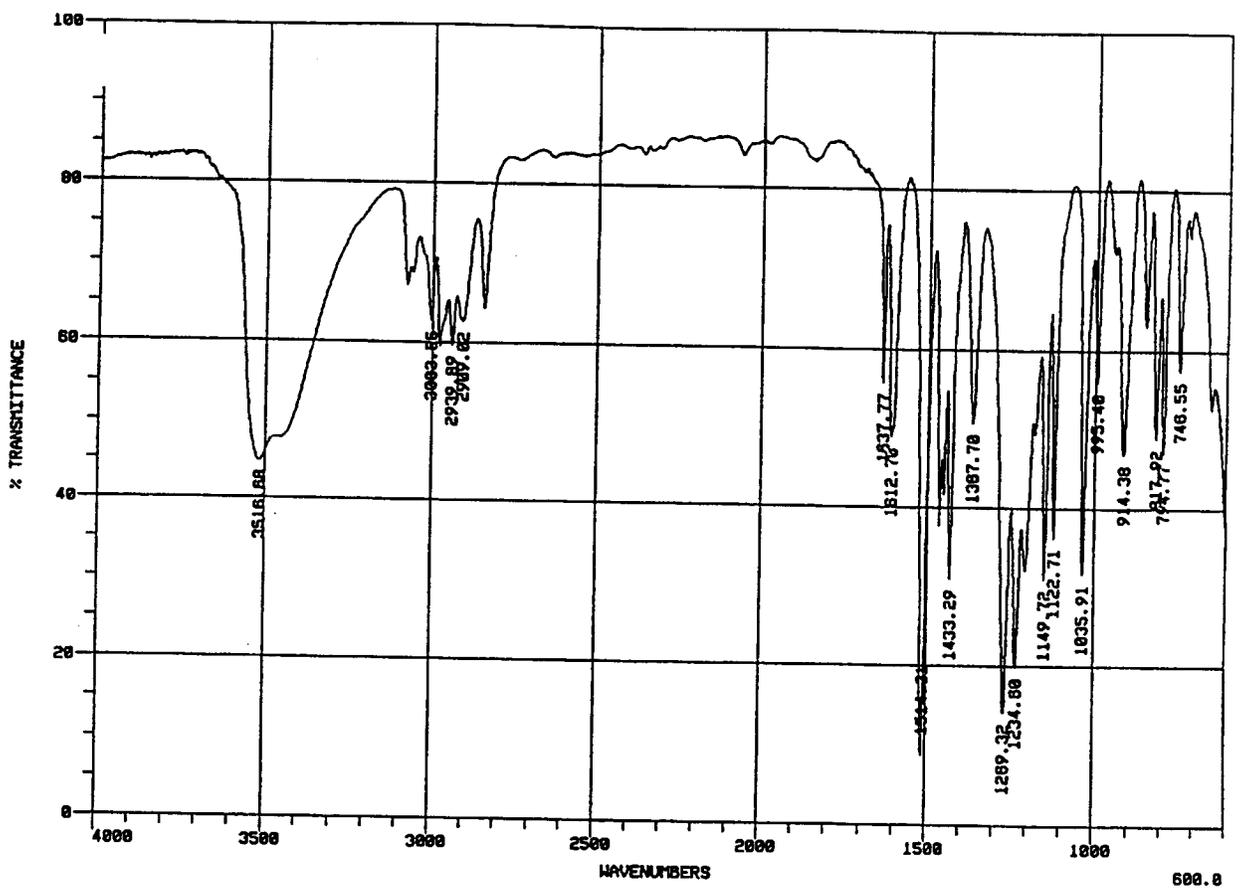

3. The spectra of the compound  $C_{10}H_{12}O_2$  are given on the next page. When the  $^1H$  NMR spectrum was measured at 500 MHz the peaks between  $\delta$  6.5-7.0 clearly resolved into two sets of doublets with the same J and a singlet. A NOESY spectrum provided additional information. The singlet showed a cross peaks with the peaks at  $\delta$  3.9, 6.0, and 3.4. The newly resolved doublet at  $\delta$  6.7 showed a cross peak with the peaks at  $\delta$  3.4. The peak at  $\delta$  5.6 exchanged with  $D_2O$ . Note that not all of the multiplicities are resolved. Give the structure of the compound, provide your rationale and assign the NMR spectra.

4. The spectra given on the next page, including the COSY given on the last page, are for a compound having the formula  $C_6H_{12}O$ .

a. Is the base peak an odd or even electron ion?

b. Give the structure of the compound showing your rationale. Use the COSY spectrum to provide a complete assignment for the  $^1H$  NMR spectrum.

Exact M.S. (EI) = 100.0888  
 UVλ<sub>max</sub> = BLANK
